

Notes on Dynamic README

- DenverCoder1's Tools

Who is he?

- DenverCoder1 is the username of Jonah Lawrence. He is a full stack developer from USA, also a youtuber at DevProTips.
- He is a Github star, which means Github officially recognised him as a top developer.

What does he discovered?

- We all know that Github README allows Markdown but the markdown doesn't allow videos, animations or JavaScript.
- So, everyone's profile looked the same with texts and images.
- He discovered that Github allows SVG images and SVG images can have CSS animation inside them.
- So if we can generate an SVG image on a server that has typing animation inside it, it will look animated even inside Github. This was his biggest discovery.

What does he created?

He created 3 main famous open-source projects to solve the following the issue. He wanted unique profiles for everyone.

1. Readme - Typing-SVG

It is a website that dynamically generates an SVG image that looks like typing. It's not a video, just a code image.

Link : <https://github.com/DenverCoder1/readme-typing-svg>

How it works :

- The backend is written in ~~PHP~~ PHP.
- He uses Google Fonts API to get fonts.
- He has a Renderer Model that validates your parameters like colour, size, width.
- Then a rendererView creates an SVG file with `<style>` and keyframes for typing and deleting animation.
- The SVG is returned as an image. Because it is an image link, Github can show it.

How to use it :

- Copy the link : <https://readme-typing-svg.demolab.com/?lines=....>
- Paste in your README as `![Typing SVG](link)`
- Github will show it as an animated typing text.
- We can customize ~~it~~ font, colour, size, speed, pause time, alignment, everything just by changing the URL ~~link~~ parameters.

Benefits of README - Typing-SVG :

- ★ It makes your profile unique and attractive.
- ★ Don't need to know animation or coding.
- ★ Can be changed by changing URL parameters.

2. Custom - Icon - Badges:

Normal shields.io badges have limited icons. He created a custom server that can generate badges with ANY icon from Simple Icons.

Link: github.com/DenverCoder1/custom-icon-badges

How it works:

- He used NodeJS, Yarn, TypeScript, and MongoDB to store icons.
- The server runs on port 5000.

How to use it:

- Use the link: <https://custom-icon-badges.demolab.com/badge/-Text-Color?style=for-the-badge&logo=iconname>
- Using this link we can have any icon.

Benefits:

- ★ You can make 100% unique portfolio.
- ★ You can match badge colour with your profile image and change the colours as you want.
- ★ It helps to look your portfolio more professional.

3. GitHub-readme-streak-stats

This tool shows your GitHub contribution streak. It reads your GitHub contribution using GitHub API, calculates your current streak, total contributions and generates a beautiful card SVG.

Link: <https://streak-stats.demolab.com>
